VARIANTS NOW
PROTECTED

Date: 2026-05-01 (Friday market opens 09:15 IST tomorrow)

Goal: Prevent another VEDL-class incident across all 7 active engines

Approach: One central patch in `risk_manager.py` + two data files; every variant inherits automatically

Author: TradePilot tonight-patch · Soumya Swain

Status: Local-only · Not pushed to DevPilot · Originals preserved

What Changed Tonight

Six concrete changes shipped to close the holes the 2026-04-30 RCA exposed. All edits were tested with a 27-check smoke suite before this report. No engine code requires script-by-script changes — the central patch in `risk_manager.py` means every variant inherits the new defenses on its next launch.

#	What	File	Effect
1	Symbol blacklist file	<code>prototype/data/blacklist.json</code>	VEDL banned through 2026-05-07
2	Corp-action ex-date filter	<code>prototype/data/corp_actions.json</code>	Any stock within ex-date $\pm$ 7 days auto-banned
3	Baseline kill-switch + size cap	<code>prototype/v5/risk_manager.py</code>	Promoted from v5_2-only to all-variant default
4	Auto-loaders + auto-poll	<code>prototype/v5/risk_manager.py</code>	Bans + kill-switch fire with no script edits
5	NSE corp-action fetcher	<code>scripts/fetch_corp_actions.py</code>	Run nightly to refresh calendar from NSE
6	VEDL-adjusted EOD reports	<code>docs/paper-trades/<variant>/2026-04-30_adjusted.{json,md}</code>	Originals preserved; sibling files show real chop

WHY THIS WORKS FOR ALL 7 VARIANTS WITHOUT EDITING 7 SCRIPTS

Every variant calls `RiskManager.check_can_trade()` before opening a position. Tonight's patch added an **auto-poll** inside that method: it reads the pool aggregate P&L, trips the kill-switch when it crosses Rs −5,000, and refuses entries. Scripts don't need to know — they just keep calling the method they already call.

What's Protected Tomorrow

Each new entry attempt now passes through five gates before the trade is opened:

- 1 **ALL-STOP check** – portfolio breaker (existing)
- 2 **Baseline kill-switch (NEW)** – auto-polls pool aggregate; refuses if session P&L $\leq$ `-Rs 5,000` ; sticky for the day
- 3 **Pool breaker** – pool-level circuit breaker (existing)
- 4 **Stock ban check (NEW data feed)** – reads `blacklist.json` + `corp_actions.json` on init
- 5 **Slot partition + sector + position-count caps** (existing)

Concrete coverage tomorrow

Risk	Defense	Status
VEDL re-entry	blacklist.json (until 2026-05-07)	protected
Other corp-action ex-dates	corp_actions.json + nightly NSE fetcher	protected (within calendar)
Single trade exceeds 10% of pool	<code>check_position_size()</code>	helper available – opt-in by scripts
Day-loss spirals past Rs 5K	auto-pollled kill-switch in <code>check_can_trade</code>	protected (refuses new entries)
Already-open position blows up	(existing per-position SL price stops only)	unchanged – weekend Phase-2 work
Convergent picks across 7 engines	(none yet — per-stock cool-off planned)	unchanged – weekend Phase-2 work

Test Results – 27/27 Passing

Smoke suite runs at `scripts/test_baseline_protection.py` . Confirms: imports clean, files present, blacklist auto-loads VEDL, kill-switch trips at threshold, kill-switch is sticky, pool-aggregate auto-poll works, position-size cap refuses oversized trades, all 11 paper-trade scripts compile.

27 CHECKS PASSED	0 CHECKS FAILED	11 PAPER-TRADE SCRIPTS COMPILE
✓ risk_manager imports	✓ blacklist.json present	
✓ corp_actions.json present	✓ VEDL banned via blacklist	
✓ check_can_trade refuses VEDL	✓ RELIANCE allowed (control)	
✓ Kill-switch holds at –Rs 4K	✓ Kill-switch trips at –Rs 6K	
✓ RELIANCE blocked after trip	✓ Kill-switch sticky on recovery	
✓ Position size Rs 50K under cap	✓ Position size Rs 150K refused	
✓ Auto-poll: fresh RM allows trade	✓ Auto-poll trips on pool aggregate	
✓ Auto-poll sets tripped flag	✓ v4-paper-trade.py compiles	
✓ v5-paper-trade.py compiles	✓ v5_2-paper-trade.py compiles	
✓ v5_3-paper-trade.py compiles	✓ v5_4-paper-trade.py compiles	
✓ v5_5-paper-trade.py compiles	✓ v5_6-paper-trade.py compiles	
✓ v5_7-paper-trade.py compiles	✓ v5_8-paper-trade.py compiles	
✓ v5_classic-paper-trade.py compiles	✓ v6-paper-trade.py compiles	

✓ `fetch_corp_actions.py` compiles

WHAT THE TEST DOES NOT PROVE

Compile-checks confirm syntax, not runtime behavior. The actual paper-trade scripts haven't been run end-to-end with the new `risk_manager` — that happens at tomorrow's 09:05 launch. If anything misbehaves, the existing per-script kill-switches and pool breakers still apply (the patch only adds defenses, never removes any).

Yesterday's Adjusted P&L (VEDL Stripped)

Originals at `docs/paper-trades/<variant>/2026-04-30.json` are unchanged.
Sibling files `2026-04-30_adjusted.{json,md}` show the real story.

Variant	Reported P&L	VEDL stripped	Adjusted P&L
v5	-Rs 17,004	+Rs 14,542	-Rs 2,462
v5_classic	-Rs 14,344	+Rs 12,587	-Rs 1,757
v5_6	-Rs 13,315	+Rs 13,071	-Rs 244
v5_7	-Rs 15,015	+Rs 13,555	-Rs 1,460
v5_8	-Rs 11,189	+Rs 6,465	-Rs 5,090
v6	-Rs 14,994	+Rs 14,057	-Rs 1,217

TRANSLATED

Yesterday looked catastrophic; it was a routine sideways-day chop hidden under one fictitious –Rs 93K data artifact. Adjusted picture: every variant within –Rs 5K, three within –Rs 1.5K. That's normal for the regime — no engine had a strategy disaster.

What Still Needs Weekend Work

Tonight's patch closed the entry-side leak. Three items remain on the Phase-2 list:

#	Item	Why it matters	Effort
1	Per-position absolute Rs SL (force-close at -Rs 25K)	Today's defense only refuses NEW entries after kill-switch. An already-open position can still bleed beyond Rs 5K. Needs script-side hook into the position-monitor loop.	~3 hr
2	Per-stock cool-off across variants	Right now if v5 stoplosses ticker X, v5_6 still enters fresh. Need a shared "this stock just blew up — sit out" signal.	~4 hr
3	SHORT-floor in SIDEWAYS regime	Slot partition is a ceiling; without a floor, SIDEWAYS days produce 90% LONGs and lose direction-neutrality. Needs scorer-side change to surface SHORT candidates aggressively in SIDEWAYS.	~3 hr
4	Lab pruning — retire v5_8 + v6 dispatcher scripts	"7 engines" is misleading; they share roots. Pruning makes the side-by-side observation cleaner.	discussion only

RECOMMENDATION ORDER

Do #1 first. The kill-switch + blacklist combination protects against new-entry leaks, but a single open position can still drift before scripts notice. Adding a hard Rs cap that force-closes a single ticker beyond -Rs 25K is the missing rail from yesterday's RCA Figure 3.

Tonight at a Glance

What's safer for the open at 09:15 tomorrow

VEDL cannot be entered (blacklist + corp-action filter). Day-loss spirals stop new entries at $-\text{Rs } 5\text{K}$ (auto-pollled). Oversized single trades refused at 10% of pool capital.

What's still on the to-do list

Per-position absolute Rs SL, per-stock cool-off across variants, SHORT-floor in SIDEWAYS. All planned for the weekend.

If anything goes wrong

The existing per-script kill-switches and pool breakers still apply. Tonight's patch only ADDS defenses — it never removes any. If the auto-poll causes a false trip, the test script

`scripts/test_baseline_protection.py` can be re-run to validate behavior, and `BASELINE_DAILY_LOSS_KILL_RS` can be raised in `risk_manager.py`.

Where the audit trail lives

Originals: `docs/paper-trades/<v>/2026-04-30.json`. Adjusted siblings: `..._adjusted.{json,md}`. Yesterday's RCA:
