

TRADEPILOT BATTLE REPORT

**6 Engines.
1 Trading Day.
Rs +10,270.**

*Post-mortem of Day 1 live-market test
featuring v5.6 Darvas & v5.7 Box Theory*

April 17, 2026 · Nifty 24,231 · VIX 17.2

*"Everything failed in interesting ways — the data taught
us more than perfection ever could."*

Executive Summary

Date	2026-04-17 (Fri) · 09:15 - 15:15 IST
Market	Nifty 24,231 · Gap UP +0.38% · Regime SIDEWAYS · VIX 17.2
Engines	v4, v5, v5.2, v5.3, v5.6, v5.7, Rust
Capital	Rs 10.00L per engine (Rs 60L aggregate)
Combined P&L	Rs +10,270 today vs +Rs 38,977 yesterday
Author	Soumya Swain · soumya@sidewall.in

Today was a stress-test: brand-new engines (v5.6 Darvas, v5.7 Box Theory — committed yesterday 21:19) went into production with no prior live-market exposure. Three Python crashes, one stuck ML retrain, and one laptop sleep event later, we came out with useful data and a clear path forward.

The Hero Stock: UNITDSPR

4 engines independently caught UNITDSPR long. v4 booked +Rs 2,835 and +Rs 1,921 on two re-entries. v5.6 and v5.7 held it through close at +Rs 1,097 and +Rs 1,791 unrealized. Cross-engine consensus validates the v4 composite scorer.

Leaderboard

Realized P&L per engine at end of day

1	v4 Composite	Rs +8,454	4W / 3L	57% win
2	v5.7 Box Theory	Rs +2,116	10W / 10L	50% win
3	v5.6 Darvas	Rs +1,183	10W / 8L	56% win
4	v5 Multi-Horizon	Rs -1,482	6W / 10L	38% win
5	v5.3 Staged	Rs +0	0 trades	sat out

Win rate comparison · v4's 80% (on 5 trades) stands out

The v5 Collapse – 95% Drop Day-over-Day

v5 went from +Rs 17,295 (92% win) yesterday to +Rs 781 (36% win) today

Four root causes

1. Shorting in a rising market (-Rs 3,566 on one stock)

v5 shorted ENRIN THREE times, lost all three: -Rs 1,098, -Rs 1,314, -Rs 1,154. Also lost JIOFIN shorts -Rs 318, TMPV -Rs 151.

Fix: Pre-market gap filter — if Nifty gap > +0.2%, disable all shorts for the day.

2. Crash wiped out morning gains (-Rs 487)

v5 crashed at 10:28 (NaN guard bug). Before crash, it had hit GODFRYPHLP target for +Rs 487 and deployed UNITDSPR. State save was pending — both were lost on restart.

Fix: Atomic state writes after every trade entry/exit, not per-cycle.

3. No same-stock re-entry block

After ENRIN short #1 hit SL, v5 re-entered ENRIN short. Hit SL. Re-entered again. Hit SL. No circuit breaker for repeated losses on same stock.

Fix: Block same-stock short re-entry for the day after 1 SL hit.

4. KALYANKJIL carry-over hit SL (-Rs 119)

Yesterday's open LONG KALYANKJIL @442.50 stopped out today at 427.65. Holding overnight added risk without commensurate reward.

Fix: Evaluate all carry-overs against opening gap before market open; exit losers proactively.

Long trades made money across all engines. Short trades lost money across all engines.

Per-Engine Trade Ledger

Watchdog Findings

The auto-restart + crash-detection infrastructure surfaced **7 bugs in itself or the environment**. Net saves during market hours: 0. The system caught bugs by breaking, not by protecting.

#1. `pgrep -f tradepilot-engine` matched watchdog itself

Impact: rust auto-restart broken

Status: Fixed v2 — port 8080 lsof check

#2. `pgrep -f 'python3 app.py'` matched watchdog itself

Impact: flask auto-restart broken

Status: Fixed v2 — port 5050 lsof check

#3. Yahoo per-stock `TypeError` fired false crash alerts

Impact: Noise notifications

Status: Fixed v3 — negative grep filter

#4. Watchdog had no market-hours awareness

Impact: Restarted v5.3 infinitely post-close

Status: Stopped manually at 16:15

#5. `sudo pmset -a disablesleep 1` silently failed (`SleepDisabled=0`)

Impact: Laptop slept in bag, ALL python engines died

Status: Never took effect — retry tomorrow, verify

#6. `caffeinate -dims` alone does not prevent clamshell sleep

Impact: False sense of protection

Status: Known limitation

#7. Engine's telegram_bot.py returns 404 on every send

Impact: Engines can't alert user directly

Status: Not fixed (my monitor works via direct curl)

Top 5 Lessons for Tomorrow

#1. NaN guard bug in 5 files

v5, v5.4, v5.5, v5.6, v5.7 all had `if price <= 0` which doesn't catch NaN (NaN<=0 is False in Python). Fixed to `if not (price > 0)`. Root cause: copy-paste propagation.

Create `utils/signal_guards.py` with shared `safe_qty(budget, price)`. One fix, all engines benefit.

#2. Shorts got destroyed in a rising market

v5 shorted ENRIN 3 times, lost 3 times for total -Rs 3,566. Same pattern in v5.6/v5.7. Regime was SIDEWAYS but Nifty gapped +0.38%.

Add pre-market gap filter: Nifty gap > +0.2% disables all shorts for the day.

#3. Laptop-in-bag is unreliable on macOS

Clamshell sleep killed all 5 paper-trade engines at ~16:15. Rust+Flask survived (launched via different shell paths).

Move engines to a \$5/mo VPS (DigitalOcean/Hetzner). 24/7 uptime, no sleep issues.

#4. pmset silently failed

`sudo pmset -a disablesleep 1` appeared to succeed but `SleepDisabled` remained 0.

Always verify with `pmset -g | grep SleepDisabled` showing 1 BEFORE trusting.

#5. State saved only at cycle end

v5 crashed at 10:28, lost GODFRYPHLP +Rs 487 win because state save was pending for the cycle.

Atomic state writes after every trade entry/exit, not per-scan.

Tomorrow's Action Plan

1. Shared `utils/signal_guard.py` — consolidate NaN protection across all engines
2. Pre-market gap filter — disable shorts if Nifty gap $> +0.2\%$
3. Migrate to cloud VPS — laptop-in-bag failed, clamshell sleep killed engines
4. Atomic state writes — save after every trade, not per-cycle
5. Same-stock re-entry block after stoploss

*"Yesterday's winning engine is today's losing engine.
The market doesn't reward yesterday."*
