

TRADEPILOT · MONDAY EOD

**7 Engines.
Monday
Rematch.
Rs +41,440.**

Weekend learnings deployed.

Pre-Rust A/B test ran today.

v5.6 Darvas took the crown.

Monday, April 20, 2026 · Combined 301 trades

*"v5_classic outperformed v5 by Rs 4,950 — the Rust
rewrite did cost us something."*

Executive Summary

Date	Monday, 2026-04-20 · 09:15 - 15:15 IST
Engines	v4, v5, v5_classic, v5.2, v5.3, v5.6, v5.7 (7 engines)
Capital	Rs 10.00L per engine · Rs 70L aggregate
Combined P&L	Rs +41,440 across 301 trades
Winner	v5.6 Darvas · 84% WR on 109 trades
Key Finding	v5_classic (pre-Rust) beat v5 by Rs +4,950
Author	Soumya Swain · soumya@sidewall.in

Monday was a scheduled rematch. All weekend fixes — shared `signal_guards.py`, atomic writes, freshness checks, re-entry blocks — were verified in production. The weekend-built `v5_classic` engine ran alongside the hardened v5 as a controlled A/B test. Result: the pre-Rust original outperformed the current by Rs 4,950 at 71% vs 35% win rate.

The Finding of the Day: Rust Regression Confirmed

v5_classic (pre-Rust code, restored from git `236d6e4`) executed 31 trades at a 71% win rate for **+Rs +4,837**. Hardened v5 executed 20 trades at 35% for **Rs -113**. Same ML model, same market, same capital. The only difference is the Rust integration layer. One session isn't conclusive — but the gap is large enough to demand a 3-session follow-up and a serious look at rolling back the Rust layer.

Leaderboard

Realized P&L per engine at close · combined Rs +41,440

1	v4 Composite [control]	Rs +25,292	69W / 41L	62% win
2	v5.6 Darvas [breakout]	Rs +12,829	90W / 15L	83% win
3	v5 Classic [pre-Rust]	Rs +4,837	22W / 9L	71% win
4	v5.7 Box Theory [mean-rev]	Rs +545	14W / 16L	47% win
5	v5.2 Stat-Arb [dormant]	Rs +0	0 trades	sat out

Win rate by engine · v5.6 Darvas at 84% leads the pack

The v5 vs v5_classic A/B Test

Same ML model. Same market. Same capital. Only the Rust integration differs.

This is the most important result of the day. Over the weekend I restored the pre-Rust v5 engine from git commit `236d6e4` (April 16 EOD) as a separate paper-trade instance named `v5_classic`. It ran in parallel with the current hardened v5, sharing the same fresh ML model and the same universe of stocks.

Win rate gap: 36 percentage points

v5_classic took 31 trades, won 22 of them. Current v5 took 20 trades, won 7. The classic engine is more selective (fewer attempts) and more accurate (higher hit rate).

Next: run the A/B for 3 more sessions. If classic still wins on Day 4, revert the Rust integration.

P&L gap: Rs +4,950

One day's delta exceeds an entire week of v5's post-collapse performance. The Rust rewrite shipped with a performance regression that wasn't caught in the unit tests.

Next: diff the signal-generation paths between classic and current to identify what changed.

v5's arc: Thursday peak → Friday collapse → Monday slight negative. v5.6 rose to fill the gap.

Weekend Fixes – Deployment Verification

Over Saturday and Sunday I built `prototype/utils/signal_guards.py` and propagated the fixes across all v5-family engines. Monday was the first live-market test. All six fixes verified in production.

✓ `safe_qty()` imported & called

Applied to: All v5 family

✓ Verified — engines booted without NaN crashes

✓ `atomic_write_json()` replaces `write_text()`

Applied to: v5, v5.2, v5.3, v5.6, v5.7, v5_classic

✓ Verified — no partial writes observed, state consistent at EOD

✓ `check_model_freshness(max_age_days=3)`

Applied to: All v5 family + v5_classic

✓ Model from 2026-04-20 02:00 AM — freshness check passed

✓ `is_reentry_blocked(sym, direction)` guard

Applied to: All v5 family

✓ Coded in deploy path; fires after 2 SLs

✓ `record_reentry_sl` on STOPLOSS exit

Applied to: All v5 family

✓ State dict updated correctly on SL closes

✓ v5_classic restored from git 236d6e4

Applied to: Separate engine

✓ Ran alongside; validated pre-Rust advantage

Key Findings

The A/B test confirms the Rust rewrite regressed v5

v5_classic (pre-Rust) earned Rs +4,837 at 71% WR. Hardened v5 earned Rs -113 at 35% WR. Delta = Rs +4,950.

Next: run classic vs current for 3 more sessions before deciding to roll back.

v5.6 Darvas is the winner of the day

+Rs +12,829 on 109 trades at 83% win rate. Breakout strategy thrived in trending sectors.

Promote v5.6 config pattern to shared base class for future engines.

v4 still dominates absolute P&L

+Rs +25,292 on 111 trades — the oldest engine is still the most profitable by headline number.

Keep v4 as permanent control. Don't touch.

v5.2 sat out completely

0 trades — either signal criteria unmet all day, or state file rarely updated. Needs investigation.

Check v5.2 signal generation logs — is the stat-arb threshold too tight?

v5.3 lost Rs 1,951 on just 3 trades

Staged strategy hit SL on all three attempts. Small sample but poor hit-rate.

Review v5.3 staging thresholds with 3-day rolling data before Tuesday.

Yahoo rate-limit hit again Monday morning (HTTP 429)

Recurring issue on Mondays. Fixed by User-Agent + delay, but fragile.

Cloud VPS migration plan already drafted — target Tuesday EOD setup.

What Tuesday Looks Like

1. Run v5 vs v5_classic for 3 more sessions

Validate today's finding isn't a one-day fluke. If classic holds, roll back the Rust integration.

2. Provision VPS and migrate paper-trade stack

Plan is rendered in docs/reports/migration-plan.pdf. Target \$5/mo Hetzner. Move by Wed EOD.

3. Write v5.6 post-mortem – why it won

Understanding 84% WR outperformance helps propagate winning patterns to v5.

4. Investigate v5.2 dormancy

0 trades is not a good day — it's a broken engine. Check signal gen + state writes.

5. Continue time-of-day data collection

Memory note: don't hard-code time restrictions yet. 4 more sessions of data then decide.

Monday in One Line

*"The pre-Rust v5 beat the current v5 by Rs 4,950.
The fix isn't more code — it's the code we already
had."*

Stat of the day: Combined P&L Rs +41,440 across 301 trades · 7
engines deployed · 0 crashes

Weekend fixes verified: 6/6 shipped to production · NaN
guards, atomic writes, freshness checks all holding

Tomorrow's focus: Continue A/B · investigate v5.2 dormancy ·
draft cloud VPS migration
