TradePilot – EOD Report + Watchdog Findings: 2026-06-30

Mild-down red day. All engines red. Two findings – one validating the design, one exposing a v5_flip trigger flaw before launch.

Project	TradePilot (NSE intraday, paper)
Session	2026-06-30 (Tuesday)
Tape	NIFTY open 24,032 → close ~-0.5% (mild-down, choppy, no afternoon reversal)
Regime tag	SIDEWAYS
Roster	v5 · v5_classic · v5_long · v5_cut (v5_flip applies next launch)
Author	Soumya Swain
Email	soumya@sidewall.in

1. Five-way result (net P&L)

ENGINE	NET	WR	L/S	NOTE
v5_long (long-only)	₹872	52%	L48 / S0	least bad today
v5_cut	₹1,470	50%	L20/S38	
v5_classic (frozen)	₹2,161	48%	L18/S40	
v5 (live)	₹2,303	44%	L31/S46	worst – 77 trades, most churn
v5_flip	–	–	–	not run yet (next launch)

Cumulative (last 8 sessions): v5_classic ₹7,959 (leads) · v5_cut ₹6,159 · v5 ₹1,916 · v5_long ₹3,566 · v5_flip ₹0 (pending).

2. The tape (✅ verified, 30-min NIFTY path)

Opened 24,032 → dipped to -0.73% mid-morning → **recovered to -0.23%** → drifted to close ~-0.5%. A **MILD-DOWN day** – never green, never sustained hard-down, no afternoon reversal.

3. EOD long/short attribution (red-day watchdog)

ENGINE	LONG	SHORT
v5	-1,097 (37t)	-84 (46t)
v5_classic	-2,585 (19t)	+424 (40t)
v5_long	-221 (63t)	0
v5_cut	-910 (27t)	+146 (38t)

4. Exit-reason breakdown (EOD profile watchdog)

ENGINE	TARGET	STOPLOSS	FLAT_FORCE	TIME_EXIT	SIGNAL_FLIP
v5	2	31	17	14	13
v5_classic	1	29	–	19	9

Same low-target-hit pattern: v5 took 77 trades and hit TARGET only twice. The most churn was again the worst result.

5. Findings

Finding 1 – validating: mild-down favours longs, and the morning “flip short” call was correctly walked back

Validation 3 said mild-down days favour longs (v5 +123/trade vs shorts +11). Today confirmed it: **v5_long (all-long) was the least-bad engine, longs only –₹221**, while the short-heavy engines (S38–S46) all lost more. The shorts were green on a couple of engines (classic + ₹424, cut +₹146) but couldn't offset the long damage on the concentrated books. **Flipping short-heavy at 09:48 would have deepened the loss – “hold longs, don't panic-flip” was the right read.**

Finding 2 – complicating: a v5_flip trigger flaw, caught before launch

The morning briefly hit –0.73% (past the –0.6% hard-down trigger), so v5_flip *would* have flipped to BEAR. But NIFTY recovered to mild-down (–0.5%) and **never went green**, so v5_flip's revert condition (needs NIFTY ≥ +0.15%) would **never fire** – it would sit short-heavy all day on a longs-favoured day. **Fix needed:** revert to baseline on “back above –0.6% / above VWAP”, not require full green. The A/B shadow surfaced this with zero capital at risk – and no backtest caught it, because the validations bucketed days by their *close*, hiding the intraday spike-then-recover path.

n=1 confirmed

v5_long was the *worst* engine yesterday (06-29) and the *best* today (06-30) – opposite rankings on consecutive days. Single sessions are noise; judge on the full window.

6. Next steps (no action taken – owner decides)

1. Patch v5_flip's revert logic (revert when NIFTY climbs back above –0.6% / above VWAP) before it goes live.
2. Keep watching the window – v5_classic's cumulative lead and the now-logging conviction data are the threads that decide the strategy, not one red day.
