

Which candle broke out – and did it matter?

Twelve of the largest multi-week gains on the NSE, drawn from real Kite bars. For each one: the breakout bar identified by rule rather than by eye, its measured geometry, the catalyst behind the move — and the number of times the same pattern appeared in that stock and failed.

PREPARED
28 August 2026

How to read one of these charts

Nothing here needs prior knowledge of markets. A candle is one day of trading drawn as a single shape, and once you can read the shape, every chart in this pack is legible.

The four numbers inside one candle

Each trading day has four prices that matter: where it **opened**, the **highest** it traded, the **lowest** it traded, and where it **closed**. A candle draws all four at once.

- The thick middle — the *body* — spans the open and the close.
- **Green** means it closed higher than it opened; **red** means it closed lower.
- The thin lines above and below — the *wicks* — reach to the day's high and low. A long wick means the price went there and came back.

Why the shape carries information

A tall green body with almost no wicks says buyers held control from open to close. A small body with a long lower wick says sellers pushed it down hard and buyers took it all back before the bell. The *proportions* are the signal, which is why every pattern in this pack is stated as a measured ratio, not as a name someone assigned by looking at it.

The two lines drawn across every chart

The **20-day** and **50-day moving averages** are simply the average closing price of the last 20 and 50 days, redrawn each day. They are the crudest possible summary of "where has this been trading lately", and they matter here for one reason: a price crossing back above them is the most widely watched confirmation signal there is, and it is something you can act on in real time.

What the shaded band and arrows mark

The shaded region is the run being studied. The green arrow marks the lowest point before the rise, the red arrow the peak. **Both were identified after the fact.** They are the ceiling — what a perfect trade would have captured — and they are printed to be compared against what was actually reachable, never as a suggestion that they were knowable at the time.

What this pack can and cannot tell you

This is the most important page in the document, and it argues against the pack's own apparent message.

These twelve were chosen because they won

The selection rule was: search five years of survivorship-free data for the largest multi-week gains. Every chart therefore ends well, and every pattern visible in them is a pattern *conditioned on success*.

That makes the usual reading — "these candles signal a breakout" — unavailable. To know whether a pattern works you need to know how often it appears and *fails*, and a sample of winners cannot answer that by construction.

So the pack answers a narrower question honestly

Not "what should we buy", but: **when a stock did run, what did the entry point actually look like at the moment it happened?** That question is answerable from winners, and its answer turned out to be uncomfortable.

The finding that changed our conclusion

All twelve optimal entries sat **below both moving averages, in a 22–60% drawdown**. That is nearly a tautology — the low of a run is by definition its point of maximum weakness — but stating it plainly kills the idea that our entry rules need tuning. At that bar, every trend signal says sell. No trend-following system can aim there.

The reachable number, beside the ceiling

Waiting for the first close back above the 50-day moving average — a signal visible in real time, with no hindsight — meant entering on average **35.9% above the low and 8.3 sessions late**. It still left **+106.5%** on the table against a perfect **+169.7%**: about 63% of the move, using information that actually existed at the time.

One unbiased fact does live inside this sample

Holding 60 sessions past the peak gave back **21% on average, and 11 of the 12 ended lower**. That measurement does not depend on how the names were picked, so unlike everything else here, it generalises.

Method – stated before the results, so it cannot be fitted to them

The breakout candle is defined in code, not chosen by eye.

Breakout = the first session after the run low whose **close exceeds the highest high of the preceding 20 sessions**, with a reset rule: after one signal fires, no further signal is counted until the close has dropped back below the 20-day MA.

Why 20 sessions. Twenty sessions is one trading month and is already the window every other measure in this pack uses (the 20-day MA, the 20-day volume average), so the breakout is measured against the same clock as its own confirmation. Nothing was tuned.

Why this and not the MA50 reclaim. Both were computed. The MA50 reclaim fires earlier on 11 of 12 names — but it fires *while price is still inside the prior range*, so it is a mean-reversion marker, not a breakout, and on 2 of the 12 (**ORIENTTECH** , **NIBE** , both recent listings) the MA50 does not exist at the entry bar at all, which makes it unusable as a common definition and produces no failure census for those names. The 20-day channel breakout is defined for any symbol with 20 bars of history. The MA50 reclaim date is still reported per symbol as a secondary marker.

Geometry is measured, not asserted. Every label carries its ratio so it can be checked: marubozu = body $\geq$ 90% of range; long-body bullish = bullish and body $\geq$ 60%; hammer = lower wick $\geq$ 2 $\times$ body and upper wick $\leq$ body; inverted hammer = the mirror; doji = body $\leq$ 10% of range; bullish engulfing = up candle whose body fully covers a prior down candle's body; gap-up = open above the prior high. Where nothing matched, the section says **no named pattern**. One of the twelve says exactly that.

The failure census. The same signal rule is run over the **126 sessions (~6 months) before the run low**. Each signal is scored: **worked** = the close gained $\geq$ +10% within 20 sessions without first closing below the breakout candle's own low; **failed** = anything else (stopped out below the candle's low, or stalled without reaching +10%). Two names (**ORIENTTECH** , **NIBE**) had only 7 and 5 sessions of listed history in that window and are excluded from the census rather than scored as zero.

Synthesis – read this first

The selection bias, in plain words

These 12 names were selected by searching for the biggest gains in the scan. Every candle described below is, by construction, a candle that worked. This document therefore shows **what winning breakouts looked like** and says **nothing whatsoever about how often a candle of that description appears and fails**. No geometry statistic, no volume median, no "dominant pattern" in the sections below is evidence that the pattern is tradeable. They are descriptions of survivors.

There is exactly **one unbiased number in this analysis**, and it is the failure census, because that census was run over a period chosen by the calendar (the six months before each low) rather than by outcome. It is the lead result:

The lead result: 0 of 11

Prior-breakout census (126 sessions before each run low)	Value
Names with a usable 6-month lookback	10 of 12
Breakout signals that fired under the identical rule	11
Of those, worked (+10% in 20 sessions, no stop)	0
Of those, failed	11 (100%)
Best any of them managed within 20 sessions	+10.1% (EDELWEISS , 2024-04-22 — stopped out first)
Median failed prior breakouts, per name	1
Loosening the rule to "touched +10% at any point, ignore the stop"	still only 1 of 11

Traded mechanically on these same twelve names, this pattern was **wrong every time before it was right once**. That is the hit rate the chart pack cannot show, and it is the number to carry forward.

Synthesis continued

The finding that matters more than the hit rate

The failed candles were **not distinguishable from the winning ones**.

Median across	Body / range	Volume vs 20-day avg
The 12 winning breakout candles	0.63	2.92x
The 11 failed prior breakout candles	0.63	2.92x

Identical to two decimal places, by accident of the data rather than design. And it goes further: on **4 of the 8 names that had any prior signal** — **HFCL**, **EDELWEISS**, **JINDALPOLY**, **PLAZACABLE** — a **failed** candle had *both* a bigger body *and* more volume than the candle that went on to double the stock. **JINDALPOLY** is the extreme: its failed 2025-08-29 signal printed a 71% body on **18.16x** average volume and went nowhere; the signal that preceded a +122% run printed a 63% body on **0.43x** volume.

Candle geometry and volume confirmation did not separate the winners from the losers in this sample. Any strategy that selects breakouts on body size or volume multiple needs to defend itself against that.

The descriptive statistics (conditioned on success – not predictive)

Measure across the 12 winning breakouts	Median
Sessions from the run low to the breakout candle	6.5
How far above the low the breakout closed	+25.8%
Volume vs its own 20-day average	2.92x
Body as a share of range	0.63
Breakout close → run peak (still on the table)	+100.3%
Peak → 60 sessions later (the give-back)	-22.4%

Geometry counts across the 12: **marubozu 3** (**DBREALTY** 95%, **CONFIPET** 92%, **SINDHUTRAD** 97%), **long-body bullish 4** (**HFCL**, **OLAELEC**, **JINDALPOLY**, **NACLIND**), **gap-up 5** (overlapping), **bullish engulfing 1**, **hammer 1**, **no named pattern 1**. Seven of twelve had a body ≥ 60% of range and **11 of 12 closed green** — the single exception, **ORIENTTECH**, gapped up and closed below its open.

So: a wide green body is the modal shape, present in 7 of 12. That is a real majority but it is **not a signature** — it is roughly what any up-session in a rising stock looks like, the failed candles shared it, and with n=12 selected for success the split is not distinguishable from noise. **Volume confirmation was near-universal in direction but not in degree**: 11 of 12 were at or above their 20-day average, but only 8 of 12 reached 1.5x, and one winner (**JINDALPOLY**, 0.43x) broke out on *less than half* its normal volume.

The exit is not the free part

Nine of twelve were lower 60 sessions after the peak, median **-22.4%**. Three were higher — **NACLIND** (+31.2%), **HFCL** (+23.3%) and **CONFIPET** (+2.8%) — and nothing at the breakout candle distinguished those three from **ORIENTTECH** (-42.2%) or **NIBE** (-38.0%). Two of the give-back figures are measured at 56 and 59 sessions rather than 60 because the data ends 2026-08-27; both are labelled in their sections.

HFCL – breakout 2026-02-18

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2026-02-18 — 17 sessions after the low
OHLCL	72.12 / 74.10 / 71.40 / 73.79
Volume	25.1M = 1.30x its 20-day average
Body / range	62% (upper wick 11%, lower 27%)
Geometry	long-body bullish (body 62% of range)
Close vs MA20 / MA50	+7.9% / +10.6%
Prior 20 sessions	Rs59.82–73.50, 20.2% wide, slope +0.86%/day
Above the run low	+21.1%
Breakout close → peak	+170.3% (Rs199.43, 2026-06-03)
MA50 reclaim (secondary)	2026-01-30, 3 sessions after the low
Failed prior breakouts, 6m	1 of 1
Peak +60 sessions	+23.3%

Structure. Not a tight base — a 20% range that had already turned up (+0.86%/day) with the breakout printing 8% above the MA20. Price had spent seventeen sessions climbing off the low before it cleared the month's high, so this is a confirmation candle, not a turn.

Why it moved. On **17 February 2026** — one session *before* the breakout candle — HFCL and subsidiary HTL announced an optical fibre cable order worth **Rs60.95 crore** from a private telecom operator, described as the second order win in a week (NewsX). The bars agree: 17 Feb closed +4.5% on 32.1M shares, the heaviest print of the month. Caveat: order-size figures differ across outlets (Goodreturns cites a much larger Rs1,366 cr HTL order, Business Standard Rs76 cr) and I could not reconcile them, so treat the exact number as unverified. The direction of the news is confirmed; the magnitude is not.

The honest column. The catalyst was public a full session before the mechanical signal — this one was knowable. But the same rule fired once before, on **2025-09-16**, on a **70% body and 2.28x volume** — a *stronger-looking* candle than the winner — and it was stopped out within 20 sessions having gained 1.5%. Score to date on this name: 1 for 2.

OLAELEC – breakout 2026-04-02

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2026-04-02 — 2 sessions after the low
OHLC	25.62 / 28.62 / 25.06 / 28.34
Volume	456M = 5.13x its 20-day average
Body / range	76% (upper wick 8%, lower 16%)
Geometry	long-body bullish (body 76% of range)
Close vs MA20 / MA50	+17.1% / +2.8%
Prior 20 sessions	Rs22.25–26.36, 17.1% wide, slope –0.00%/day
Above the run low	+24.3%
Breakout close → peak	+73.1% (Rs49.05, 2026-06-09)
MA50 reclaim (secondary)	2026-04-02 — same candle
Failed prior breakouts, 6m	1 of 1
Peak +56 sessions	–20.5% (data ends 2026-08-27)

Structure. A dead-flat 20-session range (slope –0.00%/day, 17% wide) after a –60% collapse, broken by a single 13.8%-range session on five times normal volume. This is the cleanest "flat base, violent exit" geometry in the pack, and the breakout came just two sessions after the low — the trigger and the turn were almost the same event.

Why it moved. No catalyst dated on or before 2 April was found. The available explanations — April VAHAN registrations of 12,166 units, +20% MoM against a 22% MoM industry decline (*Univest, Multibagg.ai*), and commercialisation of the 4680-format Bharat Cells (*India TV*, 10 April) — are all dated **9–10 April, a week after the breakout**. They explain the run's continuation. They were not knowable on 2 April.

The honest column. One prior signal, **2026-01-02**, on an **86% body and 2.92x volume** — a bigger body than the winner — stopped out after reaching +7.4%. On body size alone the failed candle was the more convincing of the two.

EDELWEISS – breakout 2024-07-30

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2024-07-30 — 6 sessions after the low
OHLC	65.84 / 69.49 / 64.48 / 68.56
Volume	9.25M = 2.47x its 20-day average
Body / range	54% (upper wick 19%, lower 27%)
Geometry	bullish engulfing (covers the prior down candle's body)
Close vs MA20 / MA50	+5.9% / -1.1%
Prior 20 sessions	Rs59.41–67.99, 13.3% wide, slope -0.18%/day
Above the run low	+13.3%
Breakout close → peak	+112.3% (Rs145.53, 2024-09-30)
MA50 reclaim (secondary)	2024-07-31, 7 sessions after the low
Failed prior breakouts, 6m	3 of 3
Peak +60 sessions	-11.5%

Structure. The tightest base of the twelve — a 13.3% range drifting slightly down — and the only breakout that cleared the 20-day channel while still **below** its own 50-day MA (-1.1%). A trend filter keyed to the MA50 would have rejected this candle by one day.

Why it moved. No catalyst was isolated for 30 July. What is documented is Q1 FY25: the earnings call was held **6 August 2024**, reporting consolidated PAT of Rs590 cr (+17% YoY) and alternatives AUM +17% YoY to Rs5,635 cr; by **14 August** the stock hit a 52-week high, +33% on the month (*Equitymaster*, 16 Aug 2024). That is a week *after* the breakout — continuation, not trigger.

The honest column. This name carries the worst prior record in the pack: **three** signals in six months (2024-02-19, 2024-04-22, 2024-05-17), **all three failed**. Two of them — 62% body/2.51x and 78% body/4.37x — beat the winner on *both* body and volume. The April signal reached +10.1% before being stopped. Score: 1 for 4.

DBREALTY – breakout 2025-03-21

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2025-03-21 — 4 sessions after the low
OHLC	127.70 / 152.40 / 127.25 / 151.61
Volume	24.1M = 5.22x its 20-day average
Body / range	95% (upper wick 3%, lower 2%)
Geometry	marubozu (body 95% of range)
Close vs MA20 / MA50	+20.2% / +6.2%
Prior 20 sessions	Rs115.11–138.08, 18.3% wide, slope –0.29%/day
Above the run low	+29.1%
Breakout close → peak	+66.7% (Rs252.67, 2025-07-09)
MA50 reclaim (secondary)	2025-03-21 — same candle
Failed prior breakouts, 6m	2 of 2
Peak +60 sessions	–32.0%

Structure. The most emphatic single bar in the pack: a near-perfect marubozu with a 19.8% range, opening near the low and closing near the high on 5.2x volume, clearing the 20-day channel and the MA50 in one session. If any candle here deserves the textbook label, it is this one.

Why it moved. No catalyst found in public sources. Three targeted searches over the February–April 2025 window returned nothing dated that explains 21 March. Q4 FY25 results (net sales +347% YoY) came later — the quarter had not even closed on the breakout date, so they cannot be the trigger. A 19.8%-range marubozu on 5x volume implies *someone* knew something; the public record does not say what, and this note will not invent it.

The honest column. Two prior signals, **both failed** — 2024-10-11 (62% body, 4.08x volume, never went green) and 2024-12-04 (68% body, 1.58x, +3.6% then stopped). Neither matched this bar's 95% body, which is the one case in the pack where geometry did separate the winner from the losers.

ORIENTTECH – breakout

2024-11-04

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2024-11-04 — 20 sessions after the low
OHLC	290.85 / 292.75 / 280.45 / 286.70
Volume	1.21M = 3.37x its 20-day average
Body / range	34% — and the close was below the open
Geometry	gap-up (+3.3% over the prior high); no body pattern matched
Close vs MA20 / MA50	+10.0% / MA50 undefined
Prior 20 sessions	Rs224.60–281.65, 22.1% wide, slope +0.60%/day
Above the run low	+24.8%
Breakout close → peak	+114.0% (Rs613.50, 2025-01-20)
MA50 reclaim (secondary)	2024-11-06, 22 sessions after the low
Failed prior breakouts, 6m	census not possible — only 7 sessions of listed history

Structure. The odd one out. This is the **only breakout candle in the twelve that closed red** — it gapped 3.3% above the prior high and then sold off into the close, finishing 34% body, down on the day. It still cleared the 20-day channel on close, so the rule fired. A trader waiting for a strong close would have skipped it and missed +114%.

Why it moved. Anticipation of Q2 FY25 results. The stock ran on 5–6 November "amid heavy volumes on expectations of healthy earnings," with a board meeting scheduled **11 November 2024** to approve results and consider an interim dividend (*Business Standard*, 6 Nov 2024). Results confirmed it — total income Rs225.07 cr (+50.7% QoQ), PAT Rs15.06 cr (+62.2% QoQ) — and the stock hit a 52-week high on 12 November (*Business Standard*). The board-meeting date was public in advance; the numbers were not.

The honest column. No failure count is available. ORIENTTECH listed in August 2024 and had 7 sessions of history in the 126-session lookback. The hit rate on this name is unmeasurable, and reporting it as "0 failures" would be a lie of omission.

NIBE – breakout 2025-04-01

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2025-04-01 — 9 sessions after the low
OHLC	1054.90 / 1093.40 / 1026.05 / 1093.40
Volume	77,415 = 1.11x its 20-day average
Body / range	57% (upper wick 0% , lower 43%)
Geometry	gap-up (+1.3% over the prior high), closed on its high
Close vs MA20 / MA50	+18.1% / MA50 undefined
Prior 20 sessions	Rs761.50–1080.70, 34.7% wide, slope +0.11%/day
Above the run low	+42.3%
Breakout close → peak	+83.0% (Rs2,001, 2025-06-12)
MA50 reclaim (secondary)	2025-04-25, 24 sessions after the low
Failed prior breakouts, 6m	census not possible — only 5 sessions of listed history

Structure. The loosest "base" in the pack — a 34.7% range is not a consolidation, it is a whipsaw. The breakout closed on its high with a zero upper wick, but the price had already travelled **+42.3% off the low** by then, the second-largest entry cost here. It also broke out on essentially *average* volume (1.11x), so the volume confirmation people associate with this pattern was absent.

Why it moved. No catalyst found in public sources. NIBE has a genuine record of defence order announcements — Rs57 cr from L&T (Mar 2023), a Rs292.69 cr Indian Army order (Jan 2026), a Rs563 cr loiter-munition order (Aug 2026) — but **none of them fall in the window around 1 April 2025**. They are listed here only to be explicit that they were checked and rejected on date grounds, not used.

The honest column. As with ORIENTTECH, the failure census is **unmeasurable** — 5 sessions of history. Two of the twelve names, both the ones the chart pack flagged for undefined MAs, also produce no hit-rate evidence. That is a systematic blind spot for recent listings, not a coincidence.

JINDALPOLY – breakout 2026-02-13

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2026-02-13 — 17 sessions after the low
OHLC	440.00 / 460.00 / 433.25 / 456.95
Volume	114,384 = 0.43x its 20-day average
Body / range	63% (upper wick 11%, lower 25%)
Geometry	long-body bullish (body 63% of range)
Close vs MA20 / MA50	+13.0% / +2.3%
Prior 20 sessions	Rs365.00–447.35, 20.5% wide, slope +0.68%/day
Above the run low	+24.4%
Breakout close → peak	+121.7% (Rs1,012.90, 2026-03-18)
MA50 reclaim (secondary)	2026-02-13 — same candle
Failed prior breakouts, 6m	1 of 1
Peak +60 sessions	–31.4%

Structure. Textbook shape, one glaring defect: the breakout printed on **0.43x its 20-day average volume** — the only sub-1x volume breakout in the pack, and by some margin the weakest confirmation. It still preceded a +122% run. Every volume-filter rule we own would have vetoed this candle.

Why it moved. A **board meeting on 13–14 February 2026** — the breakout date itself — approved Q3 FY26 results: standalone profit Rs75.4 cr against a consolidated loss of Rs96.9 cr, the loss driven by the May 2025 Nashik plant fire and new labour-code costs (*scanx.trade*). The nonwoven demerger to Global Nonwovens (board-approved Aug 2025) was live in the same news cycle. Confidence: medium — the results landed on the day, but the sharpest single-day moves around it (+7.2% on 6 Feb, +8.3% on 17 Feb, *marketsmojo*) carry no stated reason.

The honest column. The single most instructive pair in this document. The one prior signal — **2025-08-29** — fired on a **71% body and 18.16x average volume**, a far more convincing bar than the winner, and it **stalled without reaching +10%**. Volume screamed on the failure and whispered on the success.

CONFIPET – breakout 2026-03-12

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2026-03-12 — 3 sessions after the low
OHLC	29.80 / 35.49 / 29.35 / 35.45
Volume	9.38M = 10.73x its 20-day average
Body / range	92% (upper wick 1%, lower 7%)
Geometry	marubozu (body 92% of range)
Close vs MA20 / MA50	+12.4% / +8.2%
Prior 20 sessions	Rs28.06–34.56, 20.7% wide, slope –0.82%/day
Above the run low	+23.0%
Breakout close → peak	+127.3% (Rs80.57, 2026-06-04)
MA50 reclaim (secondary)	2026-03-12 — same candle
Failed prior breakouts, 6m	0 signals fired (full 126-session lookback)
Peak +59 sessions	+2.8% (data ends 2026-08-27)

Structure. A steadily falling 20-session range (–0.82%/day) reversed by a 20.8%-range marubozu on **10.7x** volume — the second-heaviest confirmation in the pack. Combined with **DBREALTY** and **SINDHUTRAD**, all three marubozu breakouts came on $\geq 5x$ volume.

Why it moved. No catalyst found in public sources. The move is well documented and the *cause* is not: a 19.98% upper-circuit close and delivery volume of 27.39 lakh shares, **+740.7% over the 5-day average** (*marketsmojo*) — but that is a description of the buying, not a reason for it. No order win, results date, or policy item was found for the window. Note a source discrepancy: *marketsmojo* dates the +19.98% close to 13 March at Rs35.49; the Kite bars put the +19.84% close on **12 March at Rs35.45**, with Rs35.49 as that day's *high*. Q4 FY26 results (PAT +37.5%) came later and explain continuation only.

The honest column. Zero prior signals in a full six-month lookback — the stock never once closed above its 20-day high before this. No false starts to report, and none to take comfort from either: an untested rule on this name.

NACLIND – breakout 2024-12-10

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2024-12-10 — 11 sessions after the low
OHLC	50.42 / 58.59 / 49.66 / 57.93
Volume	4.04M = 14.73x its 20-day average
Body / range	84% (upper wick 7%, lower 9%)
Geometry	long-body bullish (84%) + gap-up (+2.2% over the prior high)
Close vs MA20 / MA50	+21.6% / +19.7%
Prior 20 sessions	Rs44.92–49.91, 10.6% wide — the tightest base in the pack
Above the run low	+26.8%
Breakout close → peak	+231.1% (Rs191.78, 2025-04-22)
MA50 reclaim (secondary)	2024-12-03, 6 sessions after the low
Failed prior breakouts, 6m	1 of 1
Peak +60 sessions	+31.2%

Structure. The best-formed setup here by a distance: a **10.6%-wide** twenty-session coil, resolved by a gap-up 84%-body candle on **14.73x** average volume — the heaviest confirmation of the twelve — closing 21.6% above the MA20. If the pack contains one candle that a mechanical system should want to buy, this is it, and it went on to be the largest move (+231% from the breakout close).

Why it moved. A verified two-stage catalyst. **On 10 December 2024 — the breakout date itself** — the stock jumped ~7.8% to Rs57.32 after the company announced a board meeting for **12 December** to consider fundraising via equity, warrants or preferential issue (*Business Standard*). Warrants and shares were approved in January 2025. The far bigger driver came later: on **12 March 2025**, Coromandel International agreed to acquire a controlling **53% stake from promoter KLR Products at Rs76.7/share** (~Rs820 cr); the stock rose 65% in four sessions (*Business Standard*, 17 Mar 2025). Only the first was knowable at the breakout.

The honest column. One prior signal, **2024-06-14** — 55% body, 2.60x volume — reached +6.7% and was stopped out. The winner beat it on both metrics, which is the exception rather than the rule in this sample.

SINDHUTRAD – breakout

2025-03-19

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2025-03-19 — 2 sessions after the low
OHLC	16.25 / 19.18 / 16.25 / 19.08
Volume	11.18M = 8.02x its 20-day average
Body / range	97% (upper wick 3%, lower 0%)
Geometry	marubozu (body 97% — the largest here) + gap-up (+1.6%)
Close vs MA20 / MA50	+28.0% / +7.3%
Prior 20 sessions	Rs13.00–17.14, 28.0% wide, slope –0.70%/day
Above the run low	+43.1%
Breakout close → peak	+88.4% (Rs35.94, 2025-07-04)
MA50 reclaim (secondary)	2025-03-19 — same candle
Failed prior breakouts, 6m	1 of 1
Peak +60 sessions	–21.0%

Structure. The purest marubozu in the pack — 97% body, opening exactly on its low and closing 0.5% off its high, on 8x volume. But it fired **43.1% above the run low**, the second-worst entry cost here, and closed **28% above its own MA20**. That is not a breakout from a base; it is a chase. On a Rs16 stock the gap between the signal price and any realistic fill is material.

Why it moved. No catalyst found in public sources. Two items surfaced and both were rejected: Q4 FY25 results showed a **net loss of Rs58.98 cr** — a negative, not a driver — and the large coal-asset acquisitions (Advent Coal Resources ~Rs697 cr, Sainik Mining ~Rs225 cr) trace to an EGM dated **June 2026**, fifteen months after the breakout. Whether an initial announcement predated March 2025 could not be confirmed, so it is not being counted.

The honest column. One prior signal, **2024-10-09** — 59% body, **6.14x** volume, also a gap-up. It reached +3.5% and was stopped out. Two heavy-volume gap-up breakouts on the same stock; one doubled it, one did nothing, and they looked alike.

PLAZACABLE – breakout

2026-04-10

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2026-04-10 — 7 sessions after the low
OHLC	37.41 / 38.50 / 37.05 / 38.01
Volume	81,693 = 1.19x its 20-day average
Body / range	41% (upper wick 34%, lower 25%)
Geometry	no named pattern — fits nothing in the reference set
Close vs MA20 / MA50	+12.9% / +3.3%
Prior 20 sessions	Rs27.00–37.80, 32.2% wide, slope –0.26%/day
Above the run low	+34.9%
Breakout close → peak	+71.0% (Rs65.00, 2026-05-08)
MA50 reclaim (secondary)	2026-04-09, 6 sessions after the low
Failed prior breakouts, 6m	1 of 1
Peak +60 sessions	–23.7%

Structure. The signal candle is unremarkable in every measurable way — a 41% body inside a 3.9% range, wicked on both sides, on 1.19x volume, after a 32%-wide sprawl that was drifting down. **This is the candle that refuses a label**, and it preceded +71%. It is included precisely because a pack that only showed marubozus would be misleading about what the winning bar can look like.

Why it moved. No catalyst found in public sources. Nothing dated in the window was located. Q4 FY26 results (net profit Rs3.91 cr, +113.66%) were board-approved on **29 May 2026** — three weeks after the run had already peaked on 8 May — so they cannot be the trigger.

The honest column. One prior signal, **2026-01-29**, on a **63% body and 4.02x volume** — larger body, over three times the volume of the winner — which **stalled and went –6.0%**. On this name, the better-looking candle lost and the shapeless one won. Also recall the chart pack's constraint: at Rs0.20 cr/day median turnover, none of this is capturable at size regardless of the signal.

BHANDARI – breakout 2026-04-06

Daily candles from Kite Connect. Green arrow = run low, red arrow = run peak; both identified after the fact. Blue line = 20-day average, orange = 50-day. Volume below.

Breakout candle	2026-04-06 — 3 sessions after the low
OHLC	3.10 / 3.21 / 2.83 / 3.17
Volume	1.53M = 1.96x its 20-day average
Body / range	18% (upper wick 11%, lower 71%)
Geometry	hammer (lower wick 3.9x body) + gap-up (+6.5% over the prior high)
Close vs MA20 / MA50	+24.2% / +3.4%
Prior 20 sessions	Rs2.00–2.93, 36.7% wide, slope –0.63%/day
Above the run low	+56.2% — the worst entry cost in the pack
Breakout close → peak	+21.8% (Rs3.86, 2026-05-11)
MA50 reclaim (secondary)	2026-04-06 — same candle
Failed prior breakouts, 6m	0 signals fired (full 126-session lookback)
Peak +60 sessions	–25.5%

Structure. The only hammer, and the only case where the mechanical rule was effectively useless: the stock had already run **+56.2%** off the low in three sessions before the signal fired, leaving just **+21.8%** to the peak. A +93% move became a +22% trade. The candle itself gapped 6.5% over the prior high and then gave most of it back intraday — an 18% body with a 71% lower wick.

Why it moved. Partial and contradictory — not a confirmed catalyst. A 4-for-5 rights issue at Rs2.56 (Rs49.30 cr) closed 20 March with allotment 23–25 March, lifting promoter entity Tikani Exports from **31.02% to 41.83%** (Chittorgarh, TipRanks). But a board meeting on **6 April — the breakout date** — was convened to modify the fund-utilisation plan **because the issue was undersubscribed** (scanx.trade), which is not a bullish event. The bars confirm the ambiguity: 9 April closed **–8.08%**, three sessions after the signal. A promoter stake rose; whether that caused the move is not established.

The honest column. Zero prior signals in a full six-month lookback. Untested, like **CONFIPET** — an absence of failures, not a record of success.

Appendix – the full prior-signal census

Every signal the rule produced in the 126 sessions before each run low, with the same measurements applied. This is the table that is *not* conditioned on success.

Symbol	Signal date	Outcome	Best close gain in 20 sessions	Body/range	Volume
HFCL	2025-09-16	failed — stopped	+1.5%	0.70	2.28x
OLAELEC	2026-01-02	failed — stopped	+7.4%	0.86	2.92x
EDELWEISS	2024-02-19	failed — stopped	+3.2%	0.62	2.51x
EDELWEISS	2024-04-22	failed — stopped	+10.1%	0.56	1.22x
EDELWEISS	2024-05-17	failed — stopped	+1.5%	0.78	4.37x
DBREALTY	2024-10-11	failed — stopped	−4.0%	0.62	4.08x
DBREALTY	2024-12-04	failed — stopped	+3.6%	0.68	1.58x
JINDALPOLY	2025-08-29	failed — stalled	+1.8%	0.71	18.16x
NACLIND	2024-06-14	failed — stopped	+6.7%	0.55	2.60x
SINDHUTRAD	2024-10-09	failed — stopped	+3.5%	0.59	6.14x
PLAZACABLE	2026-01-29	failed — stalled	−6.0%	0.63	4.02x
Total		0 worked / 11 failed	median +3.2%	median 0.63	median 2.92x

CONFIPET and BHANDARI produced **zero** signals across a full lookback. ORIENTTECH and NIBE had 7 and 5 sessions of listed history and are excluded rather than scored.

Compare the last row against the twelve winners: **median body 0.63 vs 0.63, median volume 2.92x vs 2.92x**. The distributions overlap so completely that no filter built on these two variables would have separated them.
