₹-14,548 COMBINED NET P&L	365 TOTAL TRADES	44% COMBINED WIN RATE	7 / 7 ENGINES REPORTED
---	--	---	--

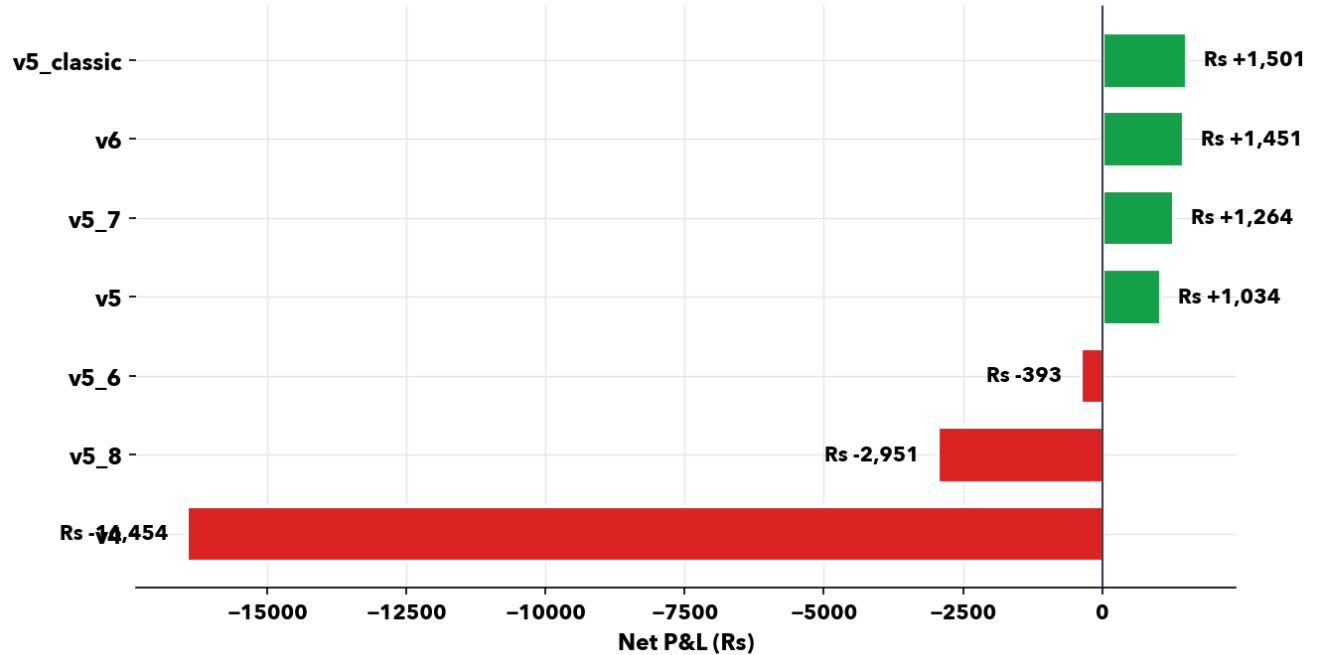

Headline Anomaly: Auto-EOD summary contradicts canonical JSON

The auto-generated `eod-comparison-daily.py` summary reports 357 trades, 0 SHORT across all 7 engines. This report (built from direct read of the per-engine JSON files) shows 365 trades with 189 SHORT (52%) and 176 LONG. The auto-summary's classifier is broken — every prior auto-EOD may be silently mis-attributing direction. Treat the auto-summary's LONG/SHORT splits as unreliable until the bug is found and fixed.

Scoreboard

#	ENGINE	NET P&L	WR	TRADES	LONG	SHORT
1	v5_classic	₹+1,501	60%	50	18	32
2	v6	₹+1,451	60%	45	16	29
3	v5_7	₹+1,264	58%	50	19	31
4	v5	₹+1,034	57%	49	16	33
5	v5_6	₹-393	51%	53	23	30
6	v5_8	₹-2,951	26%	46	45	1
7	v4	₹-16,454	10%	72	39	33

Engine Scoreboard – 2026-05-12

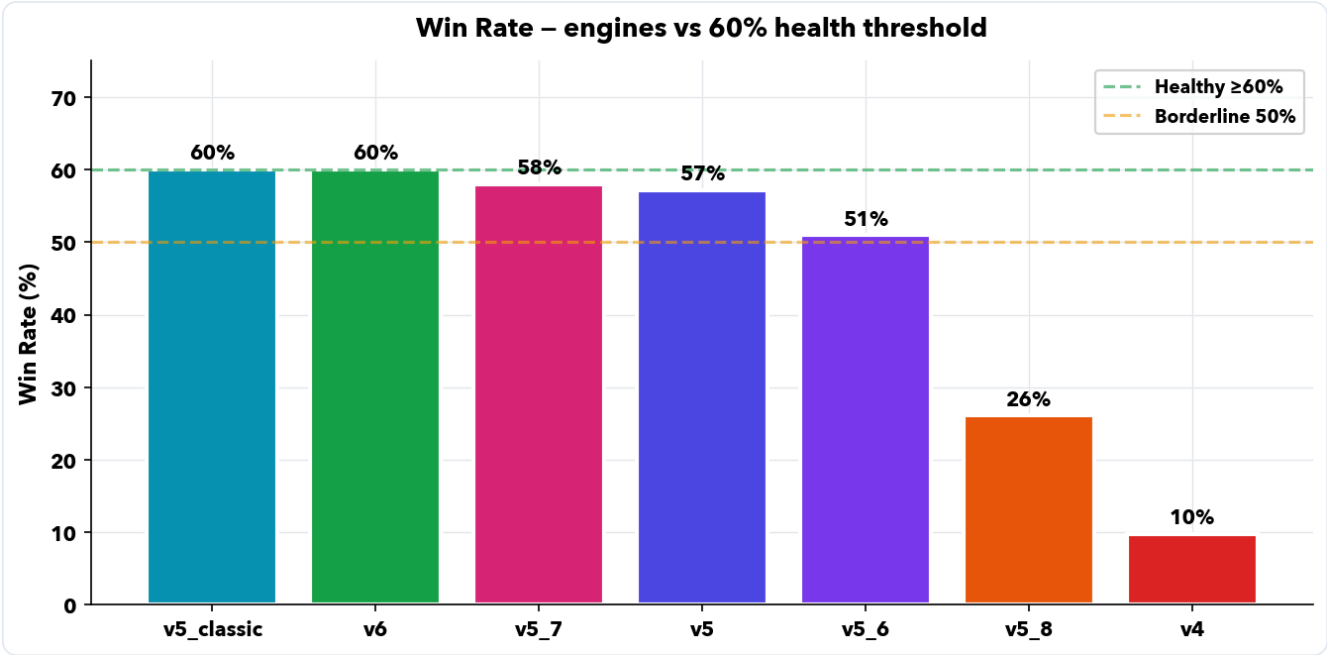

Key Findings

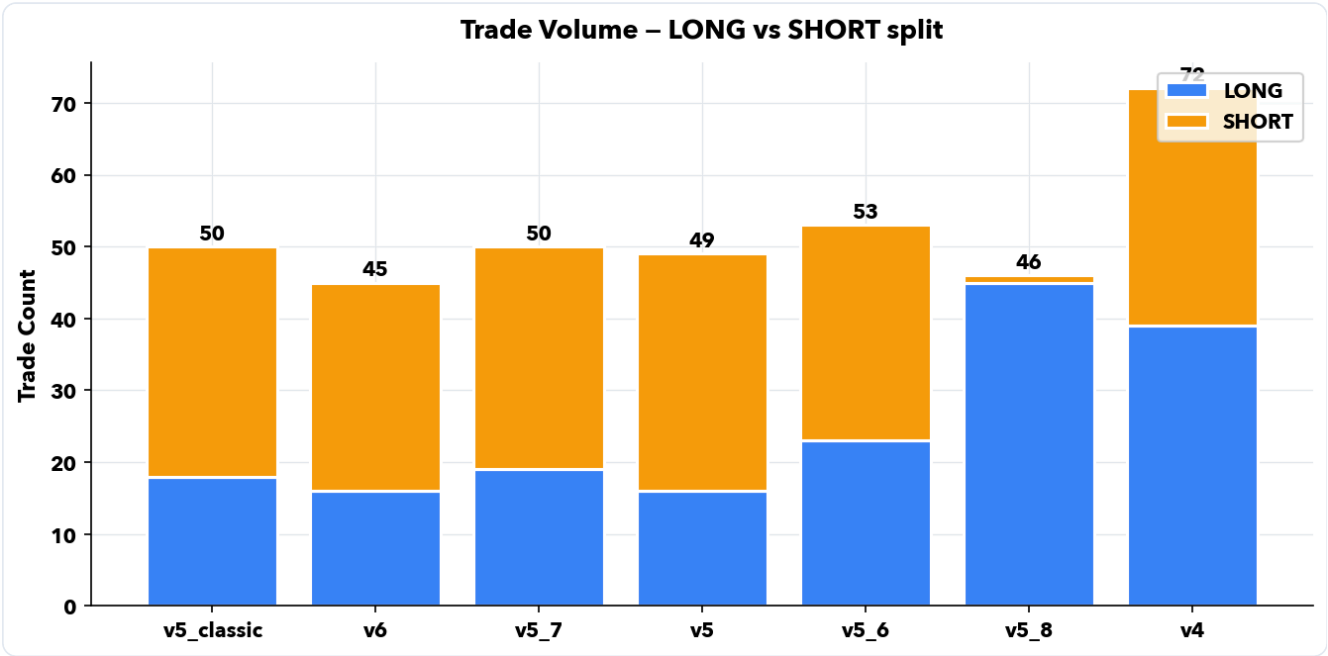

- Fleet leaned SHORT on a sideways day:** Combined split = 176 LONG / 189 SHORT (52% SHORT). Engines saw BEAR signal at 09:25 IST and committed to short exposure, but the day classifier labeled the full session SIDEWAYS. That intraday-vs-daily regime delta is itself signal — and the fleet's -Rs 14,548 loss is the cost of being SHORT into a sideways close.
- DATA BUG FLAGGED — auto-EOD miscounts SHORTs:** <docs/learning/2026-05-12-eod-summary.md> auto-generated by [eod-comparison-daily.py](#) reports all 7 engines as 0 SHORT with 357 total trades. Direct read of the per-engine JSONs (this report's source) shows 365 trades with 189 SHORTs. The summary tool's LONG/SHORT classifier is broken — investigate tonight. This bug means every prior auto-EOD summary may be silently mis-attributing SHORT vs LONG performance.
- v4's collapse — stale ML model + INTRADAY-only architecture:** v4 ran on a 3-trading-day-old model and produced 10% WR on 72 trades (39L / 33S), losing Rs 16,454. Composite-scorer + INTRADAY-only deployment appears more vulnerable to stale-model degradation than v5's multi-pool rank-then-filter approach. Today's fresh ML model is the cleanest A/B signal we'll get on this hypothesis.
- v5_8's regime-aware slot partition mostly LONG'd:** 45L / 1S vs the rest of the fleet running SHORT-heavy. On a day where SHORT-heavy lost, you'd expect v5_8's LONG bias to outperform — but it didn't (26% WR). The slot-partition is preventing trades the rank-then-filter would have taken; experiment may be value-destroying.
- v6 leads despite SHORT exposure:** 60% WR, +Rs 1,501, 16L / 29S. Rank-only logic (no Fix#1 gate) was the right call — same exposure pattern as the v5-family, but cleaner execution. Worth investigating whether v6's selector should become the dominant production path.

Cross-Engine Analysis

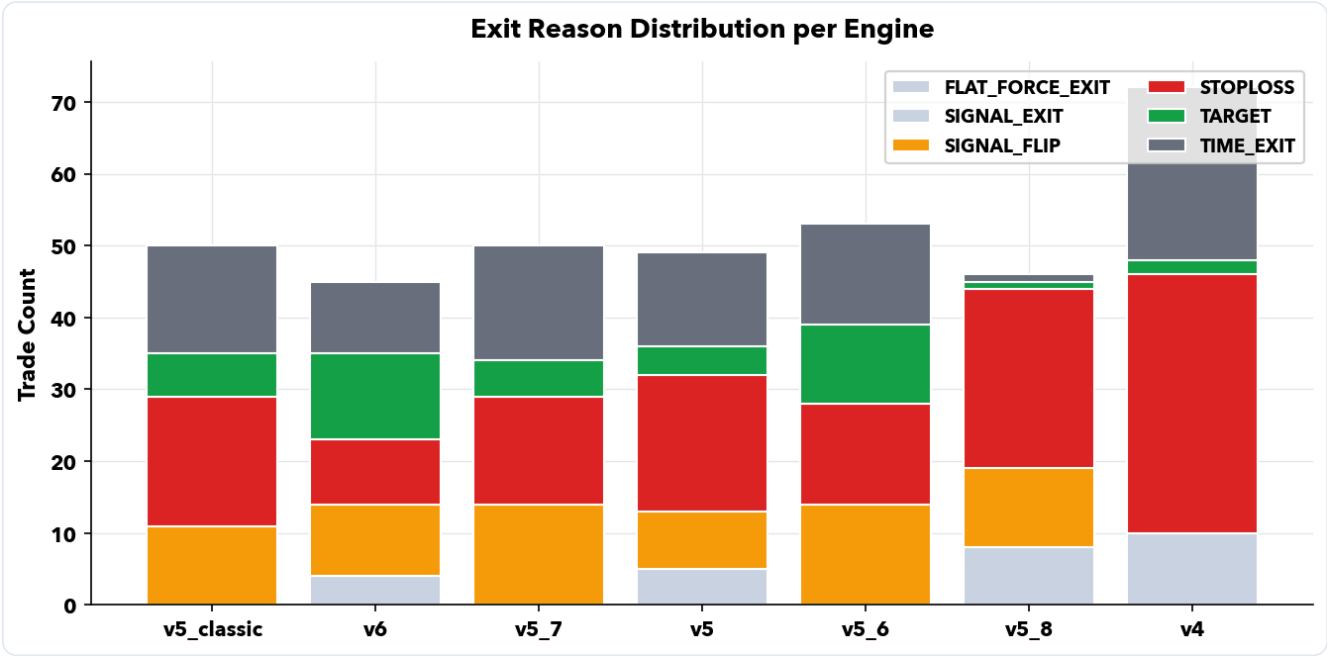

Win Rate vs Health Threshold

Trade Volume – LONG / SHORT Split

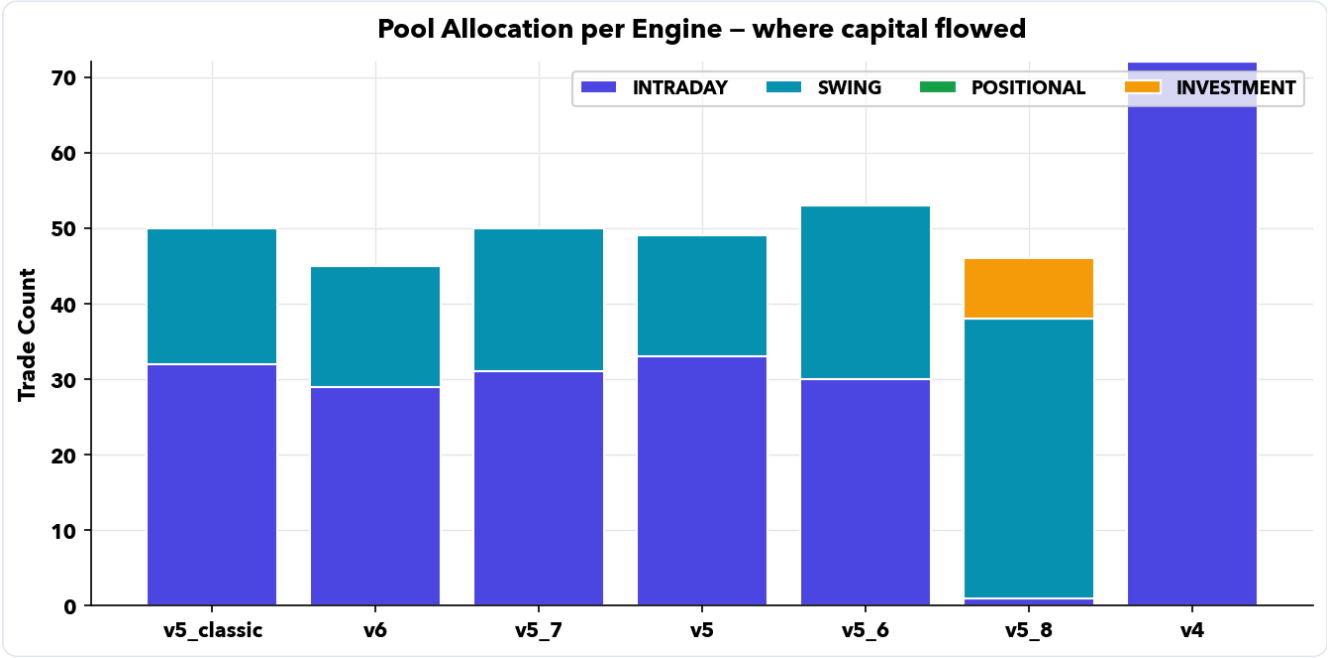

Exit Reason Distribution

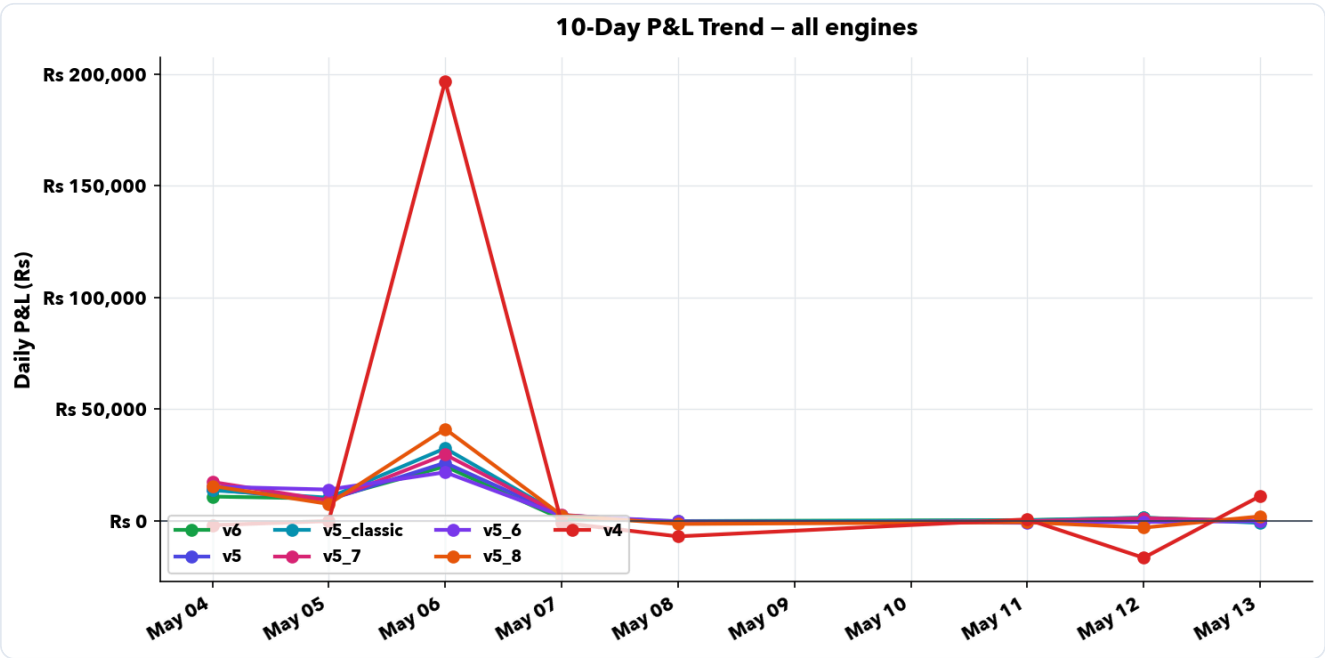

v4 dominated by TIME_EXIT (held to 15:15 close); v5-family more balanced with TARGET/STOPLOSS.

Pool Allocation

v5-family deploys across 4 pools (INTRADAY 30%, SWING 25%, POSITIONAL 25%, INVESTMENT 15%); v4 is INTRADAY-only.

10-Day Performance Trend

Day-by-day P&L per engine — May 12's combined loss is the deepest dip of the period.

Action Items for Tonight's Review

Engineering Fixes

1. **CRITICAL — Fix LONG/SHORT classifier in `eod-comparison-daily.py`** . Auto-summary reports 0 SHORTs on a day with 189 SHORTs (52%). Find which field it's reading and reconcile against `position_type` in per-engine JSON. Every prior summary's direction attribution may be wrong.
2. **Schedule nightly ML retrain in `launchd`** — add `com.tradepilot.ml-retrain-daily` firing 23:30 IST Mon-Fri. Today's morning failure (full-fleet ML staleness lockout) was a direct consequence of this gap.
3. **Patch `v5_classic`'s `NIFTY_GS_NS` 404 propagation at `prototype/v5/premarket_intel.py:95`** . Wrap or assert non-fatal. The fallback to `^NSEI` exists at line 102 but the 404 is leaking through.
4. **Investigate `v4`'s composite-scorer stale-model sensitivity** — quantify WR degradation as $f(\text{model_age})$. If correlation is strong, lower `v4`'s stale guard from 3d to 1d or add a `v4`-specific freshness check.
5. **Add intraday vs EOD regime divergence metric to `regime-switching-daily.py` output** — track how often engines commit to a regime that the day's full price action contradicts. Today's SHORT-heavy commitment on an EOD-sideways day is the canonical example.
6. **Re-evaluate `v5_8`'s regime-aware slot partition**. With LONG/SHORT classifier broken we couldn't trust direction-level historical analysis. After fixing the classifier, re-run the `v5_8` vs `v5_classic` comparison over the past 10 sessions — may need to retire `v5_8`.

Observation Watchlist

- Today's relaunch (2026-05-13) uses a freshly retrained model. Watch `v4`'s WR — if it returns to baseline (>60%), it confirms the stale-model hypothesis.
- If today is BEAR (not SIDEWAYS), watch `v5`-family SHORT emission. Fix#1 should permit absolute-weakness SHORTs on a real bear day. Zero SHORTs again would suggest the threshold is too tight.
- `v6` has now ranked top engine 2 sessions running. Worth investigating whether its rank-only logic should become the dominant production path.

Per-Engine Deep Dive

Detailed breakdown of each engine's session, sorted by P&L rank. Each section includes trade-timeline visualization and top 20 trades by absolute P&L impact.
